

COMP161 — Lab 9

Spring 2017

In this lab you'll practice basic iterative and recursive design on the classic problem of finding the max. There is no required homework with this lab. It is, however, recommended you finish it out by Friday so that reviewing the solutions is more meaningful for you.

Lab 9

On the server in `/home/comp161/sp17` you'll find `c161-lab9-starter.zip`. It contains the basic setup for implementing a basic max finding function for a vector of doubles. Get it and unzip it to your home directory. Then:

1. Put your name in each of the file headers
2. Write tests for both implementations in `lab9-test.cpp`. These tests can, and should, test the same data. The implementation doesn't change the problem.
3. Finish documentation by filling in the pre and post conditions
4. Implement the iterative version
5. Implement the recursive version

When you're done, or lab is over, submit your lab directory as assignment `lab9` using the handin script.
